

# Quizzes

Sarmad Motors Pakistan (Pvt) Ltd

## Purpose

Quizzes are auto-graded questions embedded inside a plan module. Four question shapes are supported: multiple\_choice, multiple\_response, true\_false, and scenario.

## Why this matters

Quizzes convert reading into remembering. A learner cannot advance a module until the module quiz is passed at 70 percent, which forces engagement with the source material.

| Shape             | How answered                                     | Auto-grading rule                                  |
|-------------------|--------------------------------------------------|----------------------------------------------------|
| multiple_choice   | One option out of four                           | Exact match on the correct option id               |
| multiple_response | Two or more options                              | Full match; partial credit if the plan asks for it |
| true_false        | Boolean                                          | Exact match                                        |
| scenario          | Choose the best action for a described situation | Exact match on scored option id                    |

Every quiz is source-cited. The Validation module's distractor check catches quizzes whose wrong answers are too obviously wrong.
