

OEM Dealer Standards Compliance

Syed Motors · Document Code: COMP-01 · Type: compliance · Department: All Employees

Version: 1.0

Effective: First working day of the current calendar year

Purpose

This document defines the standards required by the vehicle manufacturer for Syed Motors to remain within the requirements of its dealership franchise. The standards cover the condition and readiness of the dealership facility, the training and certification of relevant staff, the customer experience, and the checks used to confirm that the branch is meeting the required dealership standard.

The purpose of these standards is to provide a consistent operating baseline for the dealership. Facility requirements are intended to ensure that customers can access the required showroom and service areas, while staff certification requirements ensure that employees handling customers or technical work have completed the required manufacturer training. Customer-experience checks provide a regular way to identify whether the branch is maintaining the expected level of service.

These requirements apply across the relevant functions of Syed Motors. Employees are expected to understand the requirements that relate to their work and to cooperate with internal checks, manufacturer reviews, and corrective actions where a standard is not being met.

1. Facility

Syed Motors must maintain the dealership facility in accordance with the applicable OEM dealer manual. The facility standard covers the physical areas that support sales, vehicle delivery, customer waiting, and workshop operations. The current reference identified by this document is OEM dealer manual revision 4.2.

The showroom must meet the minimum area requirement specified by the OEM dealer manual. The showroom should provide the space required for normal vehicle presentation and customer interaction. The branch must also maintain the required delivery bay so that vehicle handover activities can be carried out in the designated area rather than in an unsuitable location.

Workshop capacity is also part of the dealership standard. The required number of workshop bays must be maintained in line with the applicable OEM requirement. These bays form part of the operational facility used for technical service and therefore must remain available for the branch's workshop activities.

The customer lounge and kids play area are included in the facility standard. These areas support the customer experience while customers are present at the dealership. Their inclusion in the OEM standard means that the branch must consider these areas part of its overall dealership readiness rather than treating them as optional additions.

Dealership signage is another required facility element. Syed Motors must maintain signage according to the applicable OEM dealer manual. Facility requirements should be checked against the stated OEM reference whenever the branch reviews its physical readiness or prepares for an OEM audit.

1. Facility — Compliance Expectations

The facility requirements should be treated as an ongoing operating standard. Meeting the requirement on one inspection date does not remove the need to maintain the facility afterward. Relevant dealership personnel should remain aware of the required areas and report conditions that may affect the branch's ability to meet the OEM standard.

For facility compliance, the branch should be able to demonstrate that the required showroom area, delivery bay, workshop bay count, customer lounge, kids play area, and signage have been considered against the applicable OEM dealer manual. The reference specified by this document is revision 4.2, so any facility review should use the applicable requirements from that revision unless a later approved revision has replaced it.

Facility readiness is connected to the dealership's wider compliance position. A branch that does not maintain the required physical areas may affect the ability of staff to perform normal customer-facing activities and may also create an issue during an OEM audit. For this reason, facility standards should be treated as part of routine dealership compliance rather than as a one-time preparation activity.

Where a facility issue is identified, the responsible dealership personnel should record the issue and take the appropriate internal action to restore the required standard. The document does not define a separate repair workflow, so any corrective action should follow the applicable internal process and direction from the responsible management function.

2. Staff Training

Staff certification is a mandatory part of the OEM dealer standard. Sales executives must clear the OEM's product certification before they handle customers. This requirement establishes that a sales executive must complete the required product training and certification before taking on customer-handling responsibilities.

The product certification requirement applies specifically to sales executives because their customer-facing work depends on accurate knowledge of the manufacturer's products. A sales executive who has not yet cleared the required OEM product certification must not handle customers in the capacity covered by this requirement.

Technicians have a separate technical certification requirement. Every technician must clear the OEM's Level-1 technical certification within six months of joining Syed Motors. The six-month period provides a defined training window for a newly joined technician to complete the required manufacturer certification.

The certification requirement continues after the initial qualification. Both the product-related certification for sales staff and the technical certification requirements are subject to annual recertification. Staff and management should therefore treat certification as an ongoing requirement rather than a one-time joining activity.

Training and certification status should be monitored so that the dealership can identify employees whose certification is due, incomplete, or no longer current. The purpose of this monitoring is to support compliance with the OEM standard and ensure that relevant staff remain qualified for their assigned responsibilities.

2. Staff Training — Certification Controls

For a sales executive, the key control is completion of OEM product certification before customer handling begins. This creates a clear sequence: the employee joins the dealership, completes the required OEM product certification, and only then performs customer-handling duties covered by the standard.

For a technician, the key control is completion of the OEM Level-1 technical certification within six months of joining. The branch should be able to identify the employee's joining date and certification status so that the six-month requirement can be monitored. Once certified, the technician must continue to meet the annual recertification requirement.

The dealership should keep certification information available for compliance review. If a certification is approaching its renewal point, the relevant employee and responsible management personnel should be able to identify the upcoming requirement and take action according to the applicable training arrangements.

The standard does not specify a separate training curriculum, examination format, or internal training provider. Those details should therefore be taken from the applicable OEM certification arrangements rather than being treated as additional requirements under this document.

3. Customer Experience

Customer experience is monitored through three recurring activities: weekly mystery shopping, a monthly Customer Satisfaction Index (CSI) survey, and a quarterly OEM audit. These activities provide different points of review across the dealership's customer-facing operations.

Weekly mystery shopping provides a regular check of the customer experience. Because it occurs every week, the branch should remain prepared for the customer-facing standards to be assessed as part of normal operations rather than only during scheduled internal reviews.

The monthly CSI survey provides a recurring customer feedback measure. The branch must maintain a CSI score of 850 or above on a 1000-point scale. This threshold is specifically identified in the document as the level required to avoid enrolment on the improvement plan.

The quarterly OEM audit provides a periodic manufacturer-level review. Together, the weekly mystery shopping, monthly CSI survey, and quarterly OEM audit create a recurring compliance cycle covering customer experience at different intervals.

3. Customer Experience — Monitoring and Follow-up

The CSI threshold is an important customer-experience control for the branch. A score below 850 on the 1000-point scale means the branch does not meet the stated threshold for avoiding the improvement plan. The dealership should therefore monitor its customer-experience results and remain aware of its current position against the required level.

Mystery shopping and CSI surveys serve different purposes within the standard. Mystery shopping provides a recurring observation of the dealership experience, while the CSI survey provides a measured customer satisfaction result. The quarterly OEM audit provides an additional formal review of the dealership against manufacturer expectations.

Where customer-experience results indicate that the required standard is not being maintained, the branch should follow the applicable improvement process and management direction. This document specifically identifies the improvement-plan consequence for failure to maintain the required CSI threshold; it does not prescribe the detailed contents or duration of that plan.

Customer-experience monitoring should therefore be treated as a continuing dealership responsibility. The objective is to maintain awareness of customer feedback and manufacturer review requirements while ensuring that relevant staff understand the standards applicable to their customer-facing work.

Approval and Ownership

This document is owned by the HR department and approved by the Branch Manager. The document owner is responsible for handling questions and clarifications relating to the standard. Employees who need clarification should direct their questions to the document owner rather than creating their own interpretation of a requirement.

The document is reviewed annually and revised as necessary. Its stated effective date is the first working day of the current calendar year. When a revised version is issued, the dealership should use the current approved version for its compliance activities and distinguish it from any older version retained for record purposes.

Non-compliance with the requirements in this document is a disciplinary matter under the HR Policy Manual. Employees and managers are therefore expected to treat the requirements as formal dealership standards and to raise questions or compliance concerns through the appropriate internal channel.

Document summary: This standard establishes the OEM requirements identified for Syed Motors across facility readiness, staff certification, customer-experience monitoring, review ownership, and compliance follow-up. The requirements should be maintained throughout normal dealership operations and reviewed whenever the document is formally updated.
