

Vehicle Pre-Delivery Inspection SOP

Syed Motors · Document Code: SOP-05 · Type: sop · Department: Quality Assurance

Purpose

The PDI checklist and process that every new vehicle must pass before customer handover.

Effective from the first working day of the current calendar year. Reviewed annually by the document owner and revised as necessary. Version 1.0.

1. Checklist

68-point PDI checklist covering exterior finish, panel gaps, interior trim, upholstery, electrics, engine start, brakes, steering alignment, and fluid levels. Each item is signed off by the QC inspector.

The checklist provides the inspection structure for the vehicle before handover. The listed areas cover both visible condition and operational checks, including exterior finish, interior condition, electrical functions, engine start, braking, steering alignment, and fluid levels.

Each item is signed off by the QC inspector. The sign-off establishes that the individual checklist item has been reviewed as part of the PDI process.

2. Documentation

PDI is done at least 24 hours before the scheduled delivery. Any defect found must be rectified and re-inspected. The signed PDI sheet is filed against the chassis number and a copy handed to the customer at delivery.

The documentation stage connects the inspection to the individual vehicle through its chassis number. The signed sheet provides the record of the inspection and is also shared with the customer at delivery.

3. Escalation

Any defect that cannot be rectified within four working hours must be flagged to the sales advisor and the customer, and delivery must be rescheduled with the customer's consent.

1. Checklist - Inspection Coverage

The 68-point PDI checklist is the core inspection record for a new vehicle before customer handover. It covers multiple vehicle areas rather than focusing only on visible exterior condition.

Exterior finish. The inspection includes the vehicle's exterior finish so visible presentation issues can be identified before handover.

Panel gaps. Panel gaps are included as a specific inspection area within the checklist.

Interior trim and upholstery. The interior is checked for the condition of trim and upholstery before delivery.

Electrics. Electrical functions are part of the PDI coverage.

Engine start. The inspection includes an engine-start check as part of the vehicle's operational condition.

Brakes. Braking is specifically included in the checklist.

Steering alignment. Steering alignment forms part of the inspection coverage.

Fluid levels. Fluid levels are checked before the vehicle is handed over.

QC Inspector Sign-Off

Each checklist item is signed off by the QC inspector. The sign-off is an individual confirmation against the inspection checklist rather than a single general approval.

The completed checklist therefore provides a structured record showing that the specified inspection areas were reviewed before customer handover.

Inspection Result

Where the inspection identifies a defect, the vehicle does not simply proceed directly to handover. The defect must be rectified and the vehicle re-inspected before the PDI process is considered complete.

2. Documentation - Timing and Records

PDI is completed at least 24 hours before the scheduled delivery. This timing places the inspection before the customer handover rather than treating it as a delivery-time check.

The pre-delivery timing also provides an opportunity for identified defects to be rectified and re-inspected before the scheduled customer handover.

Defect Rectification and Re-Inspection

Any defect found during PDI must be rectified and re-inspected. The process therefore has two connected actions: correcting the identified issue and checking the vehicle again after the correction.

Re-inspection is required after rectification. The original defect is not treated as closed solely because corrective work has been performed.

PDI Record Against Chassis Number

The signed PDI sheet is filed against the chassis number. This connects the inspection record to the specific vehicle and allows the document to be associated with that vehicle's handover process.

The chassis-number filing requirement also separates the PDI record from a general branch checklist. The record is tied to the individual vehicle being prepared for the customer.

Customer Copy

A copy of the signed PDI sheet is handed to the customer at delivery. The customer therefore receives the inspection record as part of the handover documentation.

3. Escalation - Unresolved Defects

The escalation rule applies when a defect cannot be rectified within four working hours. In that situation, the defect must be flagged to both the sales advisor and the customer.

The sales advisor is included because the unresolved defect affects the scheduled customer handover. The customer is informed because the delivery schedule may need to change.

Delivery must be rescheduled with the customer's consent when the defect cannot be rectified within the specified four-working-hour period.

Escalation Sequence

- 1. Identify the defect.** A defect is identified during the PDI process.
- 2. Attempt rectification.** The defect is addressed through the required rectification process.
- 3. Apply the four-working-hour condition.** If the defect cannot be rectified within four working hours, the escalation requirement applies.
- 4. Flag the issue.** The sales advisor and customer are informed of the unresolved defect.
- 5. Reschedule delivery.** Delivery is rescheduled with the customer's consent.

Relationship Between PDI and Delivery

The SOP links PDI directly to customer handover. The inspection must occur before delivery, defects must be rectified and re-inspected, and unresolved defects that meet the escalation condition require customer communication and delivery rescheduling.

Quality Assurance Responsibility

The document is owned by the Quality Assurance department. The QC inspector performs the checklist sign-off described in the procedure, while the escalation process connects unresolved inspection issues with the sales advisor and customer.

Vehicle Pre-Delivery Inspection Quick Reference

SOP-05 establishes the Quality Assurance process that every new vehicle must pass before customer handover at Syed Motors.

1. Checklist

Complete the 68-point PDI checklist covering exterior finish, panel gaps, interior trim, upholstery, electrics, engine start, brakes, steering alignment, and fluid levels. Each item is signed off by the QC inspector.

2. Documentation

Complete PDI at least 24 hours before scheduled delivery. Any defect found must be rectified and re-inspected. File the signed PDI sheet against the chassis number and hand a copy to the customer at delivery.

3. Escalation

If a defect cannot be rectified within four working hours, flag it to the sales advisor and customer. Delivery must be rescheduled with the customer's consent.

Process Summary

The PDI sequence is: complete the checklist, record QC sign-offs, identify and rectify defects, re-inspect corrected items, file the signed record against the chassis number, and provide the customer copy at delivery. Where an unresolved defect meets the four-working-hour escalation condition, communicate with the sales advisor and customer and reschedule delivery with customer consent.

Approval and Ownership

This document is owned by the Quality Assurance department and approved by the Branch Manager. Questions or clarifications should be directed to the document owner. Non-compliance is a disciplinary matter under the HR Policy Manual.
