

# Reviews (Human-in-the-loop)

Sarmad Motors Pakistan (Pvt) Ltd

## Purpose

Every validation finding is triaged by a human reviewer. The reviewer may acknowledge (agree with the validator), override (mark the finding as a false positive with justification), or send the plan back for regeneration.

## Why this matters

AI plus deterministic validator is still not a full substitute for a human sanity check. Reviews are the audit-visible checkpoint that says the plan was approved by an accountable person before it reached the employee.

## Reviewer actions

- **Acknowledge** - reviewer accepts the validator's finding. Plan is either fixed by regeneration or a note is added to the affected item.
- **Override** - reviewer marks the finding as a false positive and records a justification. The plan can proceed. The override is audit-logged with reviewer identity and timestamp.
- **Regenerate** - reviewer sends the plan back for a fresh AI run.
- **Escalate** - reviewer routes the finding to a senior reviewer for cases involving safety, legal, or dispute.

## Audit trail

Every reviewer action is written to the audit log with user, action, entity, before-state, after-state, IP address, and timestamp. Reviews cannot be edited after submission; corrections are made by a new review action referencing the earlier one.
