

Consistency Testing (Two-run Comparison)

Sarmad Motors Pakistan (Pvt) Ltd

Purpose

The Consistency module asks the generator to produce two plans for the same (employee, role, matrix, corpus) inputs and compares them. The comparison is done on structured attributes (module titles, requirement coverage, source citations) and on textual similarity of module bodies.

Why this matters

SRS Steps 44 and 45 mandate that identical inputs yield substantially identical plans across runs. A low consistency score is an early signal that the prompt template, temperature, or model has drifted.

Signal	How it is measured
Structural consistency	Overlap of module titles and covered requirement codes across the two runs
Citation consistency	Same source documents and sections cited across runs
Textual consistency	Cosine similarity of module bodies pair-wise across runs
Composite score	Weighted mean of the three, capped at 100 percent

A run pair with composite less than 70 is flagged; the reviewer investigates whether the corpus has changed or whether the prompt template needs tightening.
